

POWER ANALYZER PW8001

NEW Preview

Highest Accuracy.

Largest Number of Channels.

Maximum Flexibility.

From R&D to shipping inspections – combine the input modules that suit your application

Input module U7001

For research evaluation and shipping inspections of solar inverters

1500 V CAT II measurement

Basic accuracy for 50/60 Hz Power	±0.07%
Sampling frequency	2.5 MHz
ADC resolution	16-bit
Number of channels	Max. 8 ch
Measurement frequency band	DC, 0.1 Hz to 1 MHz
Maximum input voltage	1000 V AC, 1500 V DC
Maximum rated line-to-ground voltage	600 V AC, 1000 V DC CAT III 1000 V AC, 1500 V DC CAT II

Input module U7005

Release in 2022

High-accuracy measurement of SiC/GaN inverter efficiency and reactor/transformer loss Basic accuracy: ±0.03% Accuracy for DC Power: ±0.05%

Basic accuracy for 50/60 Hz Power	±0.03%
Sampling frequency	15 MHz
ADC resolution	18-bit
Number of channels	Max. 8 ch
Measurement frequency band	DC, 0.1 Hz to 5 MHz
Maximum input voltage	1000 V AC, 1000 V DC
Maximum rated line-to-ground voltage	600 V CAT III 1000 V CAT II

ch.8 ch.7 ch.6 ch.5 ch.4 ch.3 ch.2 ch.1

Connect a BNC-type sensor such as a current probe or CT.

Current sensor terminals
High-performance
current sensor terminals

current sensor (p.7).
The instrument will automatically identify and power the sensor.

High-performance current sensor terminals

GP-IB interface

RS-232C interface

Gigabit Ethernet interface

Optical link interface (option)
BNC sync. interface

Waveform & D/A output (option) CAN or CAN FD interface (option)

Analyze four motors simultaneously (option)

Capture the slightest power loss with a wideband power measurement of world-class accuracy

The PW8001 is engineered to help you accurately measure minuscule losses in today's increasingly efficient devices. In addition to 50/60 Hz fundamental frequencies, it delivers high-accuracy measurement performance in DC and low-power-factor switching frequency bands, which are important in power electronics devices.

Power accuracy at various frequencies

Example of active power-frequency characteristics

Multi-circuit measurement of up to 8 channels of power data with a single instrument

Mix and match two available unit types across one to eight channels to create a single-instrument measurement system that's ideally suited to your application.

Combine connections to implement a diverse range of measurement capabilities.

Example combination: 1-phase/2-wire × 8 circuits

Example combination:

Reliable reproduction of input waveforms with 15 MHz sampling and 18-bit resolution

With up to 5-times better high-speed sampling and dynamic range performance, the PW8001 takes the flagship position in our lineup of high-accuracy power analyzers, setting new benchmarks to accurately analyze loads with large fluctuations from high to miniscule power levels.

Automatic sensor identification and phase compensation* for more accurate and error-free measurements

The PW8001 can automatically acquire information about connected sensors and perform phase correction. This capability significantly reduces time spent on pre-measurement configuration and provides robust support for accurate, error-free power measurement.

*Hioki will launch a number of products that support the PW8001's automatic identification function. Please see p.7 for detailed information about the product line.

Example of the automatic phase correction for the CT6904A AC/DC current sensor

Simultaneously analyze 4 motors with a single instrument¹¹

The PW8001 can simultaneously measure four torque values and four RPM values, allowing four motors to be analyzed with a single instrument. This capability is extremely useful when analyzing systems that use multiple motors, for example electric vehicles with four wheel-mounted motors

Link two PW8001 units to double the number of channels via optical link*

By connecting two PW8001s with an optical cable (of up to 500 m in length), you can aggregate measurement data in real time on one instrument. This setup can be used as a 16-channel power analyzer, allowing you to simultaneously analyze up to 16 channels of power data and eight motors while displaying and recording efficiency and loss calculations on a single instrument.

Data can be checked with a single instrument

16 ch power measurement 8 motor analysis

CAN or CAN FD output enables to integrate measurement data into existing CAN networks¹

The PW8001 can output measurement data to a CAN bus as CAN or CAN FD signals in real time. By recording ECU data and measurement data on a CAN bus with a CAN bus data logger, you can integrate data without time shifts or degraded accuracy, enabling comprehensive

Extensive lineup of accurate current sensors enables applications from HILS development to equipment evaluation

Choose the right current sensors for your applications from an extensive selection that enables a wide range of optimal measurement solutions.

High-accuracy pass-through types

Pass-through sensors offer the ultimate level of accuracy, band, and stability. Broadband measurement of up to 10 MHz and the ability to measure large currents of up to 2000 A make these sensors ideal for use in state-of-the-art R&D.

High-accuracy clamp types

Clamp-type sensors can be affixed to the wire quickly and easily. Their exceptional environmental performance means they can be used in a broad range of settings, from HILS development to equipment evaluation.

High-accuracy direct-wired types

Our proprietary DCCT method allows our 50 A direct-wired sensor to deliver world-class accuracy and bandwidth.

Evaluation of dual-inverter drive system performance

Dual-inverter systems where each inverter drives a motor will increase reliability and efficiency. The PW8001's ability to measure eight channels of power data across a broad frequency band accurately and with excellent reproducibility is highly effective when evaluating the performance of dual-inverter systems.

Evaluation of solar inverter based power interchange systems

Power interchange systems that can accommodate both storage batteries and EVs will be a method to use energy more effectively. The PW8001's ability to accurately and simultaneously measure power at multiple points, for example at DC-DC converter, inverter, and storage battery inputs and outputs, is highly effective when evaluating solar inverter performance.
